Q: What is the validity of "one day" as a general purpose unit of time? I am aware of "one day" as a general purpose unit of time, but I am not sure about its validity. As I understand, "one day" is a compromise that agrees with human lives on the one hand, but with the requirements of machines on the other. In that case, it's not a physical representation of duration that covers all cases, but a useful compromise between people and machines. Now, it seems to me that if "one day" were really to be a fixed physical duration, it would be difficult to justify its use as a unit of time. For example, if one day were really a fixed duration, there wouldn't be any reason for the year, as there is no reference to external reality. The fact that there is reference to external reality - the date - shows that it is not a fixed physical unit, but a useful compromise. Now, to my question: What are the mathematical reasons for the "one day" being a useful compromise between people and machines, and for its validity? A: If "one day" were really a fixed physical duration, there wouldn't be any reason for the year, as there is no reference to external reality. Well, actually, the reason that year is used is so that people know the seasons of the year. For example, I'm writing this answer on a summer solstice day. Do you know what day that is? Now, to my question: 2d92ce491b
