Consider a point on a straight line  $a$  at a given height  $h$  (and its image under motion) and a point on a circle of radius  $R$  at a given height  $h'$  (and its image under motion). Define the distance between these two points as

$D = \frac{|a^2 + R^2 - 2aR \cos(\theta)|}{2R}$  where  $\theta$  is the angle of the circle with the horizontal. It is clear that the distance is always a positive number and is nonzero since we are considering a non-collinear motion. We can solve this system of equations in 3 ways: One can write  $a^2 + R^2 - 2aR \cos(\theta) = x^2 + y^2$  where  $x$  and  $y$  are the coordinates of the point on the circle and use Pythagoras' theorem to find the coordinate of the point on the line. Another way is to note that the vector  $\vec{v}$  formed by the circle's center  $C$  and the point on the line is directed from  $C$  to the point on the line. So  $\vec{v}$  is orthogonal to the circle (in 2D). Hence the angle  $\theta$  of  $\vec{v}$  to the horizontal axis is the same as the angle  $\alpha$  of  $AC$  to the horizontal axis. Therefore we can write

$a = |AC| \cos(\alpha) = |\vec{v}| \cos(\alpha) = R \sin(\alpha)$  and the same for  $\theta$ . One can write the equation of the circle in polar coordinates as  $r^2 + R^2 - 2rR \cos(\theta) = 0$ . Hence we can write

$$a^2 + R^2 - 2aR \cos(\theta) = \frac{1}{2} (R^2 + a^2 - 2aR \cos(\theta)) = \frac{1}{2} R^2 + \frac{1}{2} 2d92ce491b$$
