f May 14, 2020 - NewTone - Has been completely re-written with a new analysis and pitch engine for more accuracy, while also brushing up the workflow. "Newtone is a program that allows you to do a pitch correction on your music. First, it does a very good job at identifying the strongest pitch, and then it allows you to fine tune that pitch. Sounds easy enough, but for whatever reason, pitch correction is a very complex problem that has the potential to do real damage to your music if done incorrectly. Newtone is fairly easy to use, and allows you to tweak the settings as you see fit. The most interesting thing about this plugin is that it's not easy to use. In fact, it's a bit hard to get started and works differently than most pitch correction plugins. For example, you cannot just play a file and listen to the new pitch correction, you need to manually select the frequency range to correct. This is different from any other plugin I've tried. There are a few other features that make this plugin unique, such as the PITCH for the selection window.

The selection window will display a PITCH that stays relative to your project, and thus, relative to your pitch. So if you're in the middle of a sequence, and you're playing a different note, the plugin will still be working with your project's scale and the relative PITCH. I would say that this plugin is best suited for folks who are looking to create music that is more of a result of their creativity rather than a result of being anal and needing to hear exactly what note is hitting. This is important because sometimes you don't hear exactly what you want to hear, and sometimes there is a good chance that if you don't hear it, no one will either.
