The term _Photoshop_ does not refer to the company that manufactured the original software. It is short for _photographic_ _s_ _hop_ and simply refers to a software product written by Adobe that is dedicated to image editing. When you learn Photoshop, you learn how to apply filters, create textures, and apply special effects, as well as how to work with the various layer panels, transform tools, and tool palettes. The following sections explain the major Photoshop features, which are the foundation for any class in Photoshop. ## Scanning and converting film One of the first things you need to do with Photoshop is to scan a film. Scanning film opens up a whole world of possibilities in your art — nothing's more exciting than the new challenges that a scanner presents. Scanners are similar to a digital camera, except they create a digital image instead of a print. Figure 5-1 shows a film scanner used to create a digital image. **Figure 5-1** Scanning film is a powerful tool for producing digital images. |—| --- One of the things to remember about scanners is that they may not have the same resolution as your digital camera. A digital camera has a resolution of 3,840 × 2,160 pixels. Your scanner may only be able to recognize approximately 3,840 × 1,152 pixels as a single image. If your scanner has more pixels than the maximum, the software you use to create your digital file may crop the file to the maximum number of pixels. If you scan a movie, you may even have to run it through a miniaturizer before creating a digital copy of the image. The other thing to remember about a scanner is that it may not be able to recognize some types of film. For example, Fuji Velvia (and other film types that are not transparent) may give you a negative film image. The scanner may _crop_ the image — which means that the scanner recognizes the image as a negative, but then outputs a cropped image. While cropping your digital film allows you to save a lot of time with the editing process, you have to remember that every time you change your settings, your image will be cropped and the resulting image won't be exactly the same size as the original. You also have to use the cropping tool, which is available from the Edit menu, not the Image menu, and which was designed for cropping video

In recent years, along with increasing demands for increasing the depth of focus (DOF) of an optical system, a technique for accurately correcting curvature of field occurring in an optical system has been developed. For example, JP-A-2004-133098, JP-A-2008-187216, JP-A-2007-320853, and JP-A-2011-50210 propose techniques for correcting curvature of field occurring in an optical system. FIGS. 38A and 38B are conceptual diagrams illustrating how to correct curvature of field occurring in an optical system. FIG. 38A shows an optical system in a case where object side lens surfaces and image side lens surfaces are flat (without curvature). In this case, the entire optical system does not correct curvature of field. As shown in FIG. 38B, when a lens optical system having curved object side lens surfaces and image side lens surfaces or having curved object side lens surfaces and image side lens surfaces in different curvatures is employed as a designed optical system (design optical system), the optical system corrects curvature of field. FIG. 39A shows how to correct curvature of field occurring in a designed optical system. FIG. 39B shows the difference between the designed optical system and an actual optical system. In the designed optical system, a composition of a plurality of optical surfaces is determined to have a certain shape. In the actual optical system, due to various manufacturing errors, the shape of each optical surface differs from the determined shape. As a result, the designed optical system has curvature of field. FIG. 39A shows the designed optical system having curvature of field. In an actual optical system, the refractive index of each optical surface differs from the determined value due to manufacturing errors. In this example, the designed optical system has curvature of field. As shown in FIG. 39B, this curvature of field occurs in the designed optical system. Consequently, the designed optical system is designed such that the curvature of field occurring in the actual optical system is corrected to achieve an excellent imaging performance.Mitmachen • Re: ZVK im Wartebild verlängern
